Astronauts test HTI's forward osmosis technology in space

ALBANY, Ore. and SCOTTSDALE, Ariz. — During the recent mission aboard space shuttle Atlantis, NASA scientists tested a space-adapted version of HTI's forward osmosis hydration system, according to a [press release](#).

The **OsMem™ Forward Osmosis** membrane technology can recycle "used" water such as wastewater and even urine to provide a fortified drink that provides hydration and nutrients to astronauts with limited resources and storage in space, the release stated.

"We are very proud that our forward osmosis technology is being tested by NASA as an astronaut hydration system," said Walt Schultz, CEO of HTI. "We look forward to all the possible space flight applications using HTI's OsMem membrane."
